4. JokeSpot

5. JokeSpot is a social media platform for creating, tagging, sharing, and rating written jokes. Jokes can be browsed and filtered based on ratings, tags, and users. Other users can like or dislike jokes, with the rating appearing as a ratio of likes to dislikes. Users can comment on others' posts and those with reviewer status are highlighted. It differs from other social media platforms in the sense that its scope is purely comedic, discouraging news and discourse. This purpose is maintained by the rating system. There would also be the option to flag posts for review (report) if they get around initial checks. Superusers, content moderators, can review flagged posts and decide what to do with them.

   Like other social media platforms, people must create user accounts to create posts. User profiles will be complete with names and photos. The average rating of a user's jokes will be posted on their profiles, as well as their rankings (leaderboard) based on their average ratings. Users will be given a title based on their rating bracket. Additionally, users will be given the option to make their accounts private, excluding them from searches and making their profile stats hidden to others. Their jokes, however, will still show up on feeds, allowing others to still see their jokes and interact with them.

   Upon opening JokeSpot, the "Joke of the Day" will be displayed with a button, to go to the feed, below it. The feed is a simple, scrollable page of jokes. Like other platforms, like X and instagram, users scroll their feed, this is the primary way to view and interact with jokes. The other way is to search and filter through jokes.

6. Audience: the ideal user to jokespot is someone who appreciates one liners or text based comedy, who wants to both interact with other people's jokes, and share their own. This application serves to combine the structure of a typical social media page and consolidate jokes onto an easily accessible page to prevent the audience from having to search through multiple disjointed online forums and other media which does not prioritize humor

first. We aim to increase the size of the target audience to make the UI intuitive for all demographics, a button to create jokes being sent to the main page, and a homescreen where the newest and hottest jokes will be displayed.

7. People use Jokespot to reconnect with their sense of humor, to build community through comedy and to find a voice to express that which they find funny.

9. Agile-Kanban, utilize a Kanban board to visualize features that are complete, to be done, or in-progress. This will help determine high priority features and keep track of who is working on what. Our agile approach will allow for dynamic development and feedback as we go.

10. We plan to use a discord server to communicate about the application during the development process, this makes sharing files easy as well as making dedicated channels for specific features

11. Meeting Plan
TA Meeting: Every thursday at 2pm during TA office hours online (zoom)

Team Meetings: Mondays after lecture (4:30 ish-finish) in person in the ECCR or math building depending on availability

EXTRA CREDIT
- vulgar posts or offensive/hateful posts (High Impact): We will create an algorithm to censor posts from a csv with identified offensive content and hide it to a specific page/setting in the menu. Admins will be able to take down posts.
- privacy concerns (Medium Impact): profiles will be able to choose whether they want to be public, direct messaging will not exist on this service, and the only information being collected is profile logins, and jokes being posted into a database
- starting momentum on the platform (Low Impact): with less content, there's less engagement on the platform so to fix this, the development team will add several hundred jokes into the database to begin so that there is ample content to begin momentum
- security risks into the platform (Medium Impact): usernames and passwords will be hashed, no other sensitive personal data will be stored in the database. To aim to be completely secure, there will be very little to steal.
- loss of database (High Impact): database backups will be locally installed on developer computers so that a complete loss of database is impossible
