JokeSpot

Presented by the Goofy Goobers

An application made by Smith Mefford, Stephen Buch, Kellen Partridge, Michael Kulakovsky, and Sam Shoemaker

The joke's pot is at the end of the punchline.

Project Description

JokeSpot is a social media platform where users can view, share, and tag their jokes to the site. This platform primarily focuses on the collection of text based jokes, and collects minimal user data as that is a core ideology of the development team.

Using a very comedy forward UI, a database collects all jokes and shares the content to the feed page of the application. Registered users are welcome to create their own jokes which will be appended to the database and will be shown at the top of the feed.

This platform also features a leaderboard and joke of the day to celebrate users who have the best jokes and interact with the site the most often.

JokeSpot is made for those who want to get their dose of laughter for the day without the drama, politics, and current events dragging them down.

Tools Used

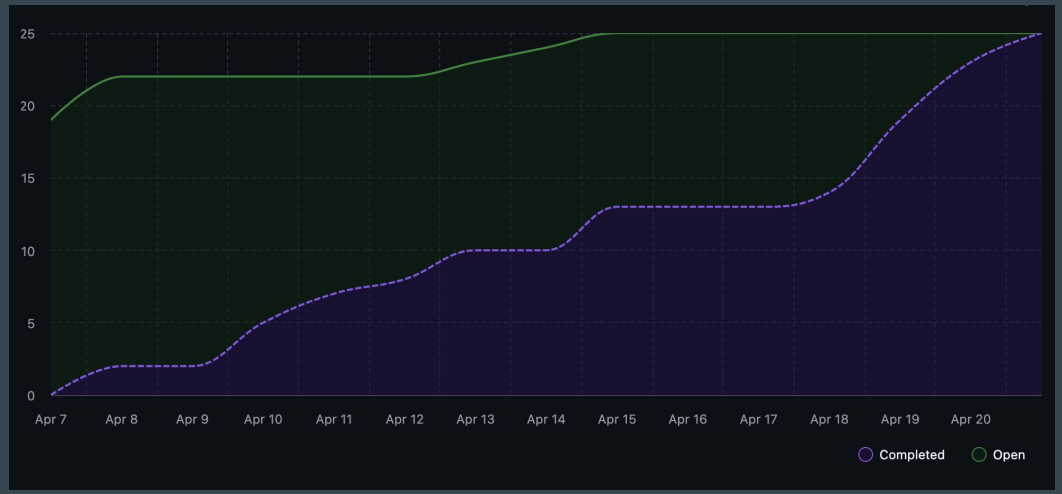
Project Tracker: Github Projects
VCS Repository: Github
Database: PostgreSQL
IDE: VS Code

UI tools: Handlebars
Application server: NodeJS
Deployment environment: Render
External APIs: None
Testing tools: Mocha & Chai
Framework: Express in Node

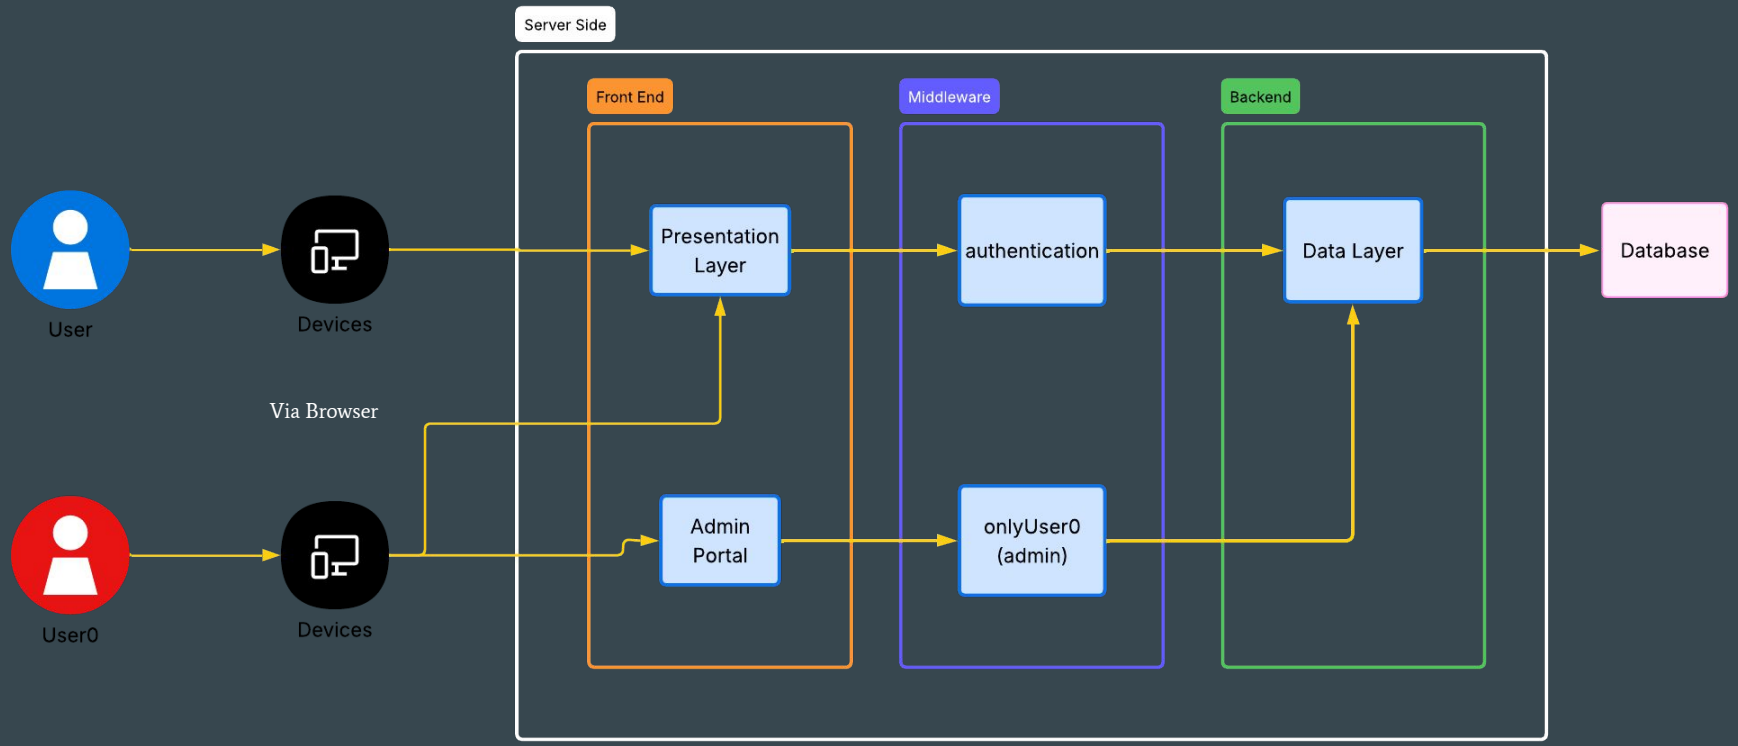
Project Management

- Used Github Projects
- Agile Development
  - Weekly meetings with TA to adjust scope if necessary.
  - Weekly meetings with group to assign tasks and reassess.
- Weekly Meetings
  - Mondays at 4:30 PM
  - Assignment of Ice Box tasks
  - TODO tasks to be done by next team meeting
  - In progress tasks are actively being done
  - Done tasks are complete

Burn-Up Chart



Architecture Diagram



Challenges Faced

Database connection
- while this wasn't a huge roadblock, we definitely put off database connection until the whole front end was developed, writing SQL queries was the focus of the last couple weeks

Image Uploading
- Adding images to the database for profile pictures was an issue because we had to figure out how to handle image files.

Censoring Profanity
- Profanity had to be handled through a CSV that contains all profanity that we want blocked, we have to run a filter through every post that cross references the csv to correctly blur the vulgar content

Future Scope

1: Twitter API:
- As the X API costs roughly 100-200 dollars/month, if this project could become funded in the future, every joke of the day would be posted daily to the official JokeSpot twitter.
2: User telemetry:
- Allow users to view their own posts, liked posts, and comments.
3: Search by profile:
- Allow users to search for other users and see their posts on a profile page.
4: Comments
- Allow users to leave comments on posts and other comments.
5: Implement cloud storage
-Better handles image uploads by having the images be hosted on a cloud storage platform.

Project Demonstration

Video of demonstration in case project does not want to work at time of presentation
